TREATING DIESEL INJECTION PUMPS WITH RVS TECHNOLOGY™ INJECTION PUMP TREATMENT

It is recommended that the engine be treated with RVS Technology™ Engine Treatment before using the product.

This package contains the quantity of the compound required for treating an injection pump of a diesel engine of up to 3 litres (3000 cm³, ~180 cubic inches) of cylinder capacity. For treating fuel injection systems of larger engines, you need more than one package that shall be used simultaneously.

TREATMENT

step by step

1. It is recommended to start the RVS Technology® Injection Pump Treatment procedures when the fuel tank is almost empty.
2. Shake the bottle well (20–30 sec.) until the mixture is homogenous. There must not remain any sediment on the bottom of the bottle.
3. Pour the contents of the bottle into the fuel tank and add the quantity of ordinary diesel fuel that is required for the mileage of 200 km (125 miles).
4. Let the engine operate for 2 to 3 hours – preferably while driving. Avoid stopping the engine during this time. Fill in fuel and continue using the vehicle as usual.
5. The treatment will automatically continue after filling in new fuel without adding any new RVS Technology™ Injection Pump Treatment compound. The treatment is complete after approximately 300 to 500 km (180 to 300 miles) of driving.
